Senior Software Engineer | GoodLeap

Cover letter

I build software for people who have another job to do. That's what interests me about GoodLeap Pros. A contractor needs to move a job forward and keep the homeowner informed, not learn the quirks of a new screen every time the product expands. The shared frontend work matters because the people using it feel every inconsistency.

I built NuPrice for a client, from the marketplace integrations and repricing rules through the customer-facing app, billing, and support. Because I also handled support, I needed to be able to trace pricing outcomes from the app back through the rules and input data. That's where I developed a habit I still use: build the workflow with enough context that the person using it and the engineer supporting it can both understand what happened.

I also built Kerf, an early TypeScript framework with a compiler and an app scaffold. Building those pieces made me think about what another developer needs to be able to do without asking the person who wrote the first version. I work the same way with coding agents. I give the change a clear scope, inspect what it actually changed, and check the result before treating it as done.

I'd like to bring that combination to Pros: a shared frontend that teams have good reasons to reach for, and enough full-stack and production experience to follow a contractor's problem wherever it starts.
